

# Knowgrph

without starting over.

*Not a replacement. An extension.*

Watch on YouTube: [airvio](#), rich media canvas for global emerging market creators

## The problem — the middle is empty

|                | Too sophisticated               | Just right                            | Too simple   |
|----------------|---------------------------------|---------------------------------------|--------------|
| Tool           | Node-graph editors · Higgsfield | ← Knowgrph fits here →                | CapCut       |
| Learning curve | Hours to days                   | Minutes                               | Seconds      |
| Local context  | Possible but manual             | Built-in to the brief                 | None         |
| Variants       | Manual wiring                   | Swap one field, N exports             | Full re-edit |
| Who it's for   | Technical users                 | Solopreneurs · freelancers · creators | Anyone       |

CapCut is fast for one video. It breaks when a creator needs ten — same brand, three markets, two formats. Every variant is a full manual re-edit. No brand memory. No locale context. No pipeline.

Node-graph editors are too steep. Higgsfield is powerful but context-blind — it doesn't know that Eid gifting is not Christmas gifting, that a Wild West frontier aesthetic needs a different energy than a Caribbean island, or that your brand font is not the default.

**Knowgrph is the middle path** — structured enough to scale, simple enough to start in minutes.

## Who it's for — global emerging market creators

### **baked in.**

This person exists in:

- Southeast Asia (Jakarta, Manila, Bangkok, Ho Chi Minh City, Singapore)
- Latin America (Mexico City, São Paulo, Bogotá, Buenos Aires)
- MENA (Cairo, Riyadh, Lagos, Dubai)
- South Asia (Mumbai, Dhaka, Karachi)
- Frontier markets everywhere — including the US creator economy's long tail and the Caribbean

What they share: they already use CapCut. They've hit a ceiling. They want to ship more, faster, without a learning curve. They want a tool that knows their market, their language, their cultural moment — without having to explain it every time.

**They don't want to replace CapCut. They want something that picks up where CapCut stops.**

## The insight — extend, don't replace

A CapCut creator already knows what good video looks like. Knowgrph handles the part that kills them: re-editing the same brief six times by hand for six markets.

If you can write a scene plan as structured Markdown, then:

- **AI becomes the orchestrator** — text node produces localised scene plans, image node renders culturally-grounded keyframes, video node composes the clip
- **The brief becomes brand memory** — palette, font, tone, cultural context, locale — locked once, inherited by every downstream node
- **Upstream change → downstream recompute** — swap one field, every variant updates automatically

TEXT

```
CapCut creator → hits variant ceiling  
→ gets Knowgrph template from a creator group  
→ runs once → ships 6 variants  
→ shares template forward → new creator joins
```

Template sharing is the distribution loop, same as CapCut templates spread today. Every share is a distribution event.

## What it does

The brief carries three locked layers:

Swap `variant: US-WEST` → `variant: CARIBBEAN`. Hook rewrites. Keyframes change. Video recomposes. **Zero manual re-edit.**

## Demo — RoboDrone X1 · Three Skies

### US · Wild West frontier mesa

- Real scene: boy on sandstone cliff at sunrise, canyon below
- Multiverse: ghost mustang herd charges silver across a sky-plain above the canyon; spectral frontier town hangs inverted from the clouds; drone leads the stampede through cathedral light arches
- Parent trust: crash-proof shell, obstacle-sense, 20-min flight
- Hook: *"Lead the ghost herd. Own the frontier."*

### Caribbean · island tempest

- Real scene: girl on white-sand beach, tropical storm rolling in off turquoise water
- Multiverse: drone punches through the rain wall; mermaid queen rises from the deep — coral crown, bioluminescent scales; drone descends as her herald through a cathedral of lightning-lit coral spires
- Parent trust: waterproof-rated, obstacle-sense, crash-proof shell
- Hook: *"Fly the tempest. Serve the queen."*

### Singapore · Marina Bay → RoboTown

- Real scene: girl on Marina Bay promenade at blue-hour dusk
- Multiverse: Merlion morphs to 100m chrome AI sentinel with amber scanning eyes; city becomes RoboTown — sensor arrays, drone corridors, neural grid bay; girl's drone ascends to command position
- Parent trust: precision sensors, 20-min flight, crash-proof shell
- Hook: *"Command the future. Your city. Your drone."*

**Canvas reveal:** pull-back from SG command position — three locale scenes materialise as glowing nodes on a dark canvas, connected by luminous bezier threads. Three parent silhouettes at each node base. A cursor hovers. One brief. Three multiverses.

# Architecture

Shell: ~248 KB gzip. Monaco, Mermaid, Three.js lazy-loaded.

## Business model

**Usage-based compute** — per-image and per-second pricing with explicit budget caps. No surprise bills.

**Template marketplace** — creators sell locale-aware pipeline templates; buyers get a proven brief-to-video workflow, not just a prompt.

## Roadmap

**Next** — batch variant generation, eval harness, scene template library, MCP server

**Later** — mobile-first brief editor (form UI over Markdown), real-time collaboration, plugin system

## The ask

**Distribution intros** — creator community leads, influencer networks, TikTok Shop / Shopee seller communities in any emerging market.

**Locale briefs** — real-world campaign specs to encode as Markdown pipelines and seed the template marketplace.

If you believe video creation should be as reusable as code — declarative, local-aware, automatable — let us build it together.
